

PLASTIC FILMS AND NETS - DATA SHEET

Plastic Film and Nets Range

POLYLUX - This our Standard Crystal Clear plastic + High UV, with durability of 3+ agricultural seasons. General purpose plastic used for early, mid & late production particularly in cooler, more northern climates.

THERMOLUX - This is our Crystal Clear High Thermic plastic. Particularly used for early production and in some cases late production which gives higher night time temperatures reducing frost risk.

KINGLUX - This is our High diffusion plastic. A cooling plastic which scatters the light spectrum for cooling crops and better light penetration in the tunnel. This plastic is designed for hotter periods & climates.

SUPERLUX - This is our High Thermic High Diffusion- Used for cooling at night and in hot climates. Not for crop forcing.

MILKYLUX & VIOLUX - available on request for high UV climate areas such as RSA and Middle East.

Extra agents to consider to add to your plastic:

> Anti-fog- particularly popular with forcing and early units where condensation and dripping is eliminated

> Anti-sulphur- recommended where high sulphur spraying is adopted or sulphur pots are being used. Without this agent the plastic can become brittle in a very short time.
